infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary infections, respiratory infections, and HIV infections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. generation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating hormone. This indirectly suppresses steroidogenesis and gamete maturation in males and females. This type of anti-self response in humans is useful in the treatment of prostate cancer and breast cancer. In livestock, the ability to stimulate an anti-self response provides a simple alternative to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental side effects associated with physical castration. Other examples of diseases and conditions treated with self proteins fused with ubiquitin are TNF and its epitopes to modulate septic shock, arthritis, inflammatory bowel disease, Crohn's disease, and ulcerative colitis; Ig epsilon heavy chain for the control of allergic reactions; chorionic gonadotropin for fertility control; and sperm proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to enhance growth rate and thereby the final weight of the livestock prior to shipment to market. In addition, the fusion proteins of the invention can be used to detect and identify antibodies from experimental samples. This sequence represents a GnRH dimer used in the construction of a chimeric fusion protein according to the method of the invention.

PT Epitope-containing fusion proteins used to generate a highly  
 PT specific immune responses  
 XX  
 PS Example 3; Page 41; 67pp; English.

CC This invention describes a novel fusion protein, comprising a heat shock  
 protein (e.g., ubiquitin), fused to an epitope(s) in a defined manner  
 which is useful for the stimulation of a highly specific immune response  
 when administered to an animal. The protein of the invention may be  
 post-translationally modified (e.g., by the addition of fatty acids to  
 enhance immunogenicity). The fusion proteins of the invention can be  
 used as vaccines to induce an immune response. When a T cell epitope is  
 attached, they can be used for control of viral infections, bacterial  
 infections, parasitic infection and cancer. The fusion proteins can be  
 used in pharmaceutical compositions for the treatment of gastrointestinal  
 diseases, pulmonary infections, respiratory infections, and HIV  
 infections. The use of ubiquitin as a scaffold is also useful for the  
 presentation and stimulation of anti-self immune responses, e.g.  
 generation of anti-gonadotropin releasing hormone antibodies which result  
 in the suppression of luteinizing hormone and follicle stimulating  
 hormone. This indirectly suppresses steroidogenesis and gamete maturation  
 in males and females. This type of anti-self response in humans is useful  
 in the treatment of prostate cancer and breast cancer. In livestock, the  
 ability to stimulate an anti-self response provides a simple alternative  
 to physical castration. Immunocastration of pigs is a better alternative  
 side effects associated with physical castration. Other examples of  
 diseases and conditions treated with self proteins fused with ubiquitin  
 are TNF and its epitopes to modulate septic shock, arthritis,  
 inflammatory bowel disease, Crohn's disease, and ulcerative colitis; Ig  
 epsilon heavy chain for the control of allergic reactions; choriocarcinoma;  
 gonadotropin for fertility control; and sperm proteins for fertility  
 control. A further use of the fusion proteins is as part of a vaccine to  
 enhance growth rate and thereby the final weight of the livestock prior  
 to shipment to market. In addition, the fusion proteins of the invention  
 can be used to detect and identify antibodies from experimental samples.  
 CC This sequence represents a GnRH mixed dimer used in the construction of  
 a ubiquitin fusion protein described in the method of the invention.

XX PT Epitope-containing fusion proteins used to generate a highly specific immune responses

XX PS Claim 81; Page 43; 67pp; English.

CC This invention describes a novel fusion protein, comprising a heat shock protein (e.g. ubiquitin), fused to an epitope(s) in a defined manner which is useful for the stimulation of a highly specific immune response when administered to an animal. The protein of the invention may be post-translationally modified (e.g. by the addition of fatty acids to enhance immunogenicity). The fusion proteins of the invention can be used as vaccines to induce an immune response. When a T cell epitope is attached, they can be used for control of viral infections, bacterial infections, parasitic infection and cancer. The fusion proteins can be used in pharmaceutical compositions for the treatment of gastrointestinal diseases, pulmonary inflections, respiratory inflections, and HIV infections. The use of ubiquitin as a scaffold is also useful for the presentation and stimulation of anti-self immune responses, e.g. generation of anti-gonadotropin releasing hormone antibodies which result in the suppression of luteinizing hormone and follicle stimulating hormone. This indirectly suppresses steroidogenesis and gamete maturation in males and females. This type of anti-self response in humans is useful in the treatment of prostate cancer and breast cancer. In livestock, the ability to stimulate an anti-self response provides a simple alternative to physical castration. Immunocastration of pigs is a better alternative to physical castration, as it does not result in any of the detrimental side effects associated with physical castration. Other examples of diseases and conditions treated with self proteins fused with ubiquitin are TNF and its epitopes to modulate septic shock, arthritis, inflammatory bowel disease, Crohn's disease, and ulcerative colitis; Ig epsilon heavy chain for the control of allergic reactions; chronic gonadotropin for fertility control; and sperm proteins for fertility control. A further use of the fusion proteins is as part of a vaccine to enhance growth rate and thereby the final weight of the livestock prior to shipment to market. In addition, the fusion proteins of the invention can be used to detect and identify antibodies from experimental samples. This sequence represents a GnRH fragment used in the construction of a ubiquitin fusion protein described in the method of the invention.

XX PT Immunogens and vaccine comprising the immunogen useful for preventing cancer, comprises peptide and carrier from protein D of influenzae

XX Disclosure; Page 7; 53pp; English.

CC The present invention describes an immunogen (I) comprising a peptide (Ia) and a carrier (Ib) derived from Protein D of Haemophilus influenzae or its fragment. Also described are: (1) a vaccine comprising (I), and an excipient; (2) preparation of (I), comprising conjugating a peptide to protein D or its fragment; and (3) preparation of a vaccine of (I), comprising formulating (I) with an excipient (I) has cytostatic, antiallergic, nootropic, neuroprotective and protozoacide activities. CC (I) and the vaccine are useful for the manufacture of a medicament for preventing and treating infectious diseases such as malaria or chronic disease such as cancer, Alzheimer's disease or allergy in a patient. CC Unlike prior art immunogens, (I) induces high levels of anti-peptide immune responses while inducing a moderate humoral response against the carrier. The present sequence represents an example of an immunogen from CC (GnRH) tandem dimers.

Novel fusion protein for producing a dual immune response comprises a

PT peptide analogous to an endogenous peptide which is to be inhibited,

PT connected to a peptide analogous to an immunogen from a pathogen which

PT infects a vertebrate.

PS Disclosure: Fig 2; 93pp; English.

XX The present sequence represents a cattle gonadotropin releasing

CC hormone (GnRH) tetramer, i.e. comprising 4 repeats of the GnRH

CC native decapeptide (see Y96084). DNA (see A50548) encoding the

CC tetramer was obtained by the annealing and cloning of GnRH-encoding

CC oligonucleotides (see A50541-47). GnRH tetramer constructs were

CC utilised in the novel fusion proteins of the invention also

CC comprising a bovine herpesvirus type 1 (BHV-1) antigen. These

CC fusion proteins (see Y96089-91 and Y96093) are used as vaccines,

CC producing a dual immune response that is effective in inhibiting

CC sexual characteristics in cattle and also in protecting against

CC BHV-1, a causative agent of bovine respiratory disease. Sexual

CC characteristics that can be inhibited include aggression in males,

CC and fertility in males and females, the latter providing a means of

CC contraception.

Fusion proteins comprising LHRH analogue and TratP (analogue) -

PT useful in vaccine for inhibition or control of reproduction in

PT vertebrates, esp. domestic animals

XX XX

Example 1; Fig 2 and 5; 53pp; English.

XX PS

PT Fusion proteins comprising LHRH analogue fusion in which two copies

CC of an LHRH analogue have been inserted between amino acids 200 and

CC 201 of TratP (ogata R.T. et al., 1982) J.Bacteriol. 151:819-827).

CC The plasmid was constructed by inserting DNA encoding the LHRH

CC analogue into the Smal site of pBTA73 (see Q1015) which all ready  
 CC carries one copy of the LHRH sequence. After transformation,  
 CC colonies with two LHRH molecules are identified. Fusion proteins  
 CC with multiple inserts generated a higher anti-LHRH response (as  
 CC measured by the binding of ( $^{125}$ I)-LHRH at a serum dilution of  
 CC 1:2000 final) than constructs with a single insert, in outbred mice  
 CC and dogs. The fusion proteins can be used to inhibit reproductive  
 CC functions in vertebrates.

PS	Example 1; FIG 8A-D; 93pp; English.		
XX			
CC	The present sequence is that of a tmgD-4GnRH fusion protein encoded by a nucleotide insert (see A5053) of plasmid pQE-gp:GnRH. It comprises a bovine herpes virus type 1 (BHV-1) truncated mature glycoprotein D (tmgD) antigen joined at the C-terminus to a bovine gonadotropin releasing hormone (GnRH) tetramer. There is also an N-terminal 6XHIS leader peptide. tmgD-4GnRH is an example of fusion proteins of the invention comprising: a first protein analogous to a protein endogenously synthesized within a vertebrate, the activity of which is to be inhibited within the vertebrate, and which is incapable by itself of eliciting an effective immunoinhibitory response in the vertebrate; and a second protein, which is an immunogen from a pathogen capable of infecting the vertebrate, and which causes the vertebrate's immune system to recognise the first protein, producing a response that inhibits the activity of the first protein, and also protecting the vertebrate from infection by the pathogen when the vertebrate is vaccinated with the fusion protein. In the present case, the tmgD-4GnRH fusion protein		

elicits a dual immune response that is effective in inhibiting sexual characteristics (e.g. aggressive behavior in males, and fertility in males and females, the latter providing a means of contraception) in cattle, and also in protecting against infection by BHV-1, a causative agent of bovine respiratory disease.
